

IMARCH Launches Chronicle OS: Monograph Publication, Academic Partnerships, and a Digital Ecosystem for Research Orchestration

London, United Kingdom — 12 June 2026

IMARCH LTD announces the publication of the interdisciplinary monograph *"Architecture of Sovereign Science and Multi-Agent Orchestration of Digital Ecosystems."*

The work has been deposited in the international open-science repository Zenodo and assigned DOI 10.5281/zenodo.20611942. The monograph consists of eleven chapters, each accompanied by independent DOI registration and cryptographic SHA-256 verification.

The publication establishes the methodological, economic, and architectural foundations of **Chronicle OS**, a research infrastructure designed to support transparent scientific communication, digital priority protection, and institutional knowledge management.

Key Project Components

Academic and Institutional Partnerships

IMARCH LTD has entered into strategic cooperation initiatives with academic institutions, including UMSS University (Ukraine), and has established preliminary collaboration agreements with a number of distinguished scholars representing medicine, engineering, biology, and humanities.

These experts participate in the development of the editorial framework for a new scientometric publication environment planned under the IMARCH ecosystem.

Chronicle OS Research Infrastructure

Chronicle OS is designed as an integrated environment combining:

- cryptographic registration of research outputs;
- DOI-based scientific priority fixation;
- transparent peer-review workflows;
- publication lifecycle management;
- digital preservation of scientific records.

The platform aims to strengthen trust, transparency, and accessibility within contemporary research ecosystems.

Universal Formology and Knowledge Structuring

The project incorporates methodological developments referred to as **Universal Formology**, a framework intended to support structural classification, semantic consistency analysis, and interdisciplinary knowledge organisation.

These approaches are being explored as instruments for reducing ambiguity in scientific communication and improving expert evaluation processes.

Submission and Review Infrastructure

A dedicated submission environment for scientific materials and reviewer registration has been launched and integrated with a SHA-256-based cryptographic repository.

This infrastructure enables timestamped preservation of deposited materials and provides an additional layer of verifiability for authorship and publication history.

Digital Hubs and Collaborative Platforms

The ecosystem currently integrates several specialised initiatives, including:

- **Vis Realitatis**, a visualisation and knowledge representation hub;
- **CCS (Collective Cybernetic Security)**, a collaborative framework focused on digital resilience and institutional coordination.

Science, Technology, and Human Performance

As part of its broader ecosystem strategy, IMARCH also supports interdisciplinary initiatives connecting scientific methodology, digital technologies, and human performance.

Among these activities are projects involving veteran athletes and world-record achievements that demonstrate the practical application of evidence-informed approaches to training, rehabilitation, and healthy longevity.

These initiatives serve as experimental environments for testing and validating

interdisciplinary methodologies developed within the ecosystem.

> ***Statement***
> *"Our objective is to create an institutional environment where science, digital technologies, and human expertise operate within a transparent and verifiable framework. The publication of this monograph and the establishment of academic partnerships represent important steps toward international validation, collaborative research, and future grant opportunities."*
